Sprint Planning 1 — Meeting Notes

Attendees: Arvin, Ernest, Ryan (Chua Wee Chye), Kai Jie, Irfan, Tristan **Time:** ~22:35 – 23:58 (Zoom, call split into two parts after the 40-min limit)

---

1. Scrum process decisions

- **Sprint length: 2 weeks.** Justification given: one week isn't enough time to complete meaningful work.
- Roughly **4 sprints** total for the project.
- The scrum process itself has to be written up and **justified** in the docs — and the team also has to **reflect on and adapt the process** over the project, with evidence of adaptation.
- **Irfan set up the Jira project** and shared the URL; everyone created accounts. He was effectively taken as **Scrum Master**.
- Google Doc convention: **yellow highlight = relevant to the project / core functionality.**

2. Jira setup

- User stories go in the **Backlog**, not the Board (per the Week 3 lab).
- Structure: **Product backlog → Sprint backlog** (create sprint via the button in Jira), then pick what goes into the sprint.
- **Story point estimate field had to be enabled**: Board settings → Estimation → Story points. (Someone had switched it to "Original estimate"; fixed.)
- Each story's **description holds the user story text + acceptance criteria**.
- Priority convention: relevant → **Medium** by default, not relevant → **Low**; architecture/infra stories bumped to **High/Highest**.
- Duplicates cleaned up (two "withdraw attendee registration", two "register for event").
- Clarified: the **product backlog can keep being added to** throughout, and stories can be added to a sprint — but the **sprint goal cannot change** mid-sprint.

3. Backlog content

- Started by transferring everyone's own user stories into Jira.
- Added **indirect/architecture stories** that weren't in the original list: set up database, set up authentication, create database diagram (2–3 pts), initial project template / folder structure.
- Read through the core functionality list to find gaps. Identified as **missing or incomplete**:
    - User authorisation and authentication → covered by "Set up authentication"

    - **Event review and approval** — existing "View event status" only covers half; needs updating to include approval
    - **Coordinator assignment** (submitted events assigned to an event coordinator) — added
- Realisation: each of the ~20 **functionality areas is effectively an epic**, made up of multiple user stories. Related stories (e.g. register for event + join waiting list) should sit under the same epic.
- Ended around **12 stories**, **~44–63 story points** in the backlog at that point.
- **Open question parked:** whether email notifications are actually in scope for core functionality — to be settled later.

4. Estimation

- Method: **planning poker on the Fibonacci scale (1, 2, 3, 5, 8, 13)**.
- **Baseline: "View event status" = 2** (chosen as the easiest story).
- Points assigned during the session:

Story	Points
View event status	2
Submit event request	2
Submit event change request	2
Block venue for maintenance	2
Save draft event request	5
Search for suitable venues (filtering)	5
Mark event as completed	3
Register for an event	3
Withdraw attendee registration	3
Reserve equipment (incl. notification)	3
Join attendee waiting list	3 (provisional, pending email decision)
Approve/reject venue booking request	3–5
Update equipment availability status	3–5
Create database diagram	2–3
Set up database	8
Set up authentication (Firebase)	~5

- Stories with no description yet (e.g. approve/reject booking) were flagged to be filled in.

5. Capacity

- Debate on velocity: Ernest proposed **8 points per person per sprint**; Arvin argued 8 is too low and suggested 10; Ryan felt 10/person was too much.
- **Landed on ~8 points per person per sprint → ~48 points as a group per sprint**, targeting the first sprint to complete before **Week 6**. Roughly 200 points over 4 sprints, which leaves buffer even after the backlog grows.

6. Tech stack

- **Frontend:** started on Next.js + Tailwind, then **switched to Vue** — most of the team hadn't used Next, UI polish earns no marks, so simpler is better. Figma for any design.
- **Language:** TypeScript (noted as stricter JavaScript); team is mixed on familiarity.
- **Database: Supabase** (relational SQL); ER diagram to be drawn first.
- **Auth: Firebase** — Ryan has used it before and will own it.
- **Testing:** Playwright mentioned.
- **Not using:** Docker, CI (agreed not required).
- Prof's requirement noted: decide **architecture and tech stack and produce a C1/C4 diagram before starting** — i.e. a "sprint zero", as real companies do.

7. Sprint 1 plan and ownership

- Sprint 1 built from the **highest-priority stories**, anchored on architecture work.
- **Database diagram should be done in week 1**, with the database itself set up in week 2 — the rest of the team is blocked on the schema (correct table/field names) before they can code or test anything.
- **Ryan → authentication** (Firebase experience).
- One person to own the database setup/diagram.
- **Sprint goal** drafted by Ryan and put in Jira, roughly: *enable event organisers to create and save event requests* — essentially the **event request creation** epic.
- Tristan's point (agreed as the better order for next time): **set the sprint goal first, then pick the stories that serve it** — rather than picking stories and then writing a goal.

Action items

- [ ] Ryan — finalise and edit the sprint goal in Jira; own Firebase authentication setup
- [ ] Owner TBC — database ER diagram by end of week 1, Supabase set up in week 2

- [ ] Ernest — fix priorities (a few Highest, rest High/Medium); keep cleaning duplicates
- [ ] All — review the estimates and speak up if you disagree
- [ ] All — fill in missing descriptions and acceptance criteria on your stories
- [ ] Update the "event review and approval" story to include approval, not just status viewing
- [ ] Add the initial project template / folder structure story
- [ ] Decide whether email notifications are in scope
- [ ] Write up the scrum process + justification in the docs, and keep evidence of process adaptation

3. Sprint Review

Week 3 asks whether you built the right thing and what you learned from stakeholders. Hold it at the end of the sprint with the Scrum Team and key stakeholders invited by the Product Owner.

- **Compare the outcome with the plan.** Restate the Sprint Goal and say whether you achieved it. Walk through what met the Definition of Done and what remained open. If you track velocity, count points only for fully Done stories. Reconsider unfinished items in the Product Backlog and record whether you replan, split, change, or drop them.
- **Inspect a working workflow.** Show the increment across the relevant roles and features. For example, demonstrate a coordinator requesting a venue, Venue Staff deciding on it, and the confirmed booking affecting availability. Show a relevant conflict or failure case if it was part of the completed scope.
- **Discuss feedback and make a backlog decision.** Record what stakeholders actually observed or requested, how the team interpreted it, and whether the Product Owner changed an acceptance criterion, added a story, reordered work, or deferred it. Identify who gave the feedback. Label team observations as such when they came from internal inspection.
- **Check progress toward the release.** Identify remaining gaps in the core workflows and any effect on the next sprint's priorities.

Capture the end-of-sprint board, burndown if tracked, Done and unfinished story IDs, actual completed points or throughput where used, review feedback, and the resulting backlog changes. Keep a demo or recording timestamp and link the most relevant PRs or tests.

4. Sprint Retrospective

Week 3 asks how the team should change the way it works. The whole Scrum Team attends, and the Scrum Master helps facilitate. Use **Start / Stop / Continue** or **4Ls** to structure the discussion.

- **Revisit the previous action.** Did the team try it? What evidence shows whether it helped?
- **Discuss what went well and what caused friction.** Cover people and coordination, estimation, tooling, reviews, testing, CI, AI-assisted rework, and the Definition of Done where relevant. Ground the discussion in an incident the team can point to.
- **Agree on one or two concrete improvements.** Give each one an owner, a time to start, and a way to check whether it helped. For example, if PRs repeatedly waited on reviewers, try assigning a reviewer when a PR opens and check review turnaround next sprint.
- **Follow through.** Put the action where the team will see it during the next sprint. If an action comes from the final retro and hasn't been tried yet, describe it as an agreed next step.

Capture the retro board or notes, the incident behind each action, the owner, and evidence from a later sprint where available. An early issue followed by a documented change and a later result is a concrete example of the process improvement the rubric asks for.

Sprint 2: 20 sept - 3 oct

Discuss in the meeting	Capture for submission
Why this sprint? The Product Owner explains the highest-priority customer needs. Agree on one Sprint Goal that describes a usable outcome. For example, “An organiser can submit an event request and a coordinator can review it and communicate a decision.”	Sprint Goal, dates, and the customer need or release priority behind it.
What can we finish? Walk through the candidate story IDs, acceptance criteria, dependencies, and open questions. Decide what to include, split, or defer. If a Week 7 customer change affects this sprint, identify the stories, workflow steps, and tests it changes.	Selected stories and any important deferral or scope decision, with the reason and affected story IDs.
Why is that scope realistic? Compare the proposed work with recent completed work and this sprint’s actual availability. If you used planning poker, capture one estimate disagreement, the assumptions behind it, and what the team agreed after discussing it. Include review, testing, and integration effort when sizing a story. If you planned using throughput, show how completed item counts informed selection.	Actual estimation method, one worked example, prior completed points or throughput, capacity constraints, and planned scope. For an early sprint with limited history, record the assumption you used.
How will we deliver it? Sequence dependencies, break stories into tasks where useful, and agree how each workflow will be integrated and verified. Confirm what your Definition of Done requires. Developers can volunteer for tasks as the sprint progresses.	Start-of-sprint backlog or board export showing the goal, selected stories, and initial tasks. Include relevant test, review, or integration tasks.

3. Sprint Review

Week 3 asks whether you built the right thing and what you learned from stakeholders. Hold it at the end of the sprint with the Scrum Team and key stakeholders invited by the Product Owner.

- **Compare the outcome with the plan.** Restate the Sprint Goal and say whether you achieved it. Walk through what met the Definition of Done and what remained open. If you track velocity, count points only for fully Done stories. Reconsider unfinished items in the Product Backlog and record whether you replan, split, change, or drop them.
- **Inspect a working workflow.** Show the increment across the relevant roles and features. For example, demonstrate a coordinator requesting a venue, Venue Staff deciding on it, and the confirmed booking affecting availability. Show a relevant conflict or failure case if it was part of the completed scope.
- **Discuss feedback and make a backlog decision.** Record what stakeholders actually observed or requested, how the team interpreted it, and whether the Product Owner changed an acceptance criterion, added a story, reordered work, or deferred it. Identify who gave the feedback. Label team observations as such when they came from internal inspection.
- **Check progress toward the release.** Identify remaining gaps in the core workflows and any effect on the next sprint's priorities.

Capture the end-of-sprint board, burndown if tracked, Done and unfinished story IDs, actual completed points or throughput where used, review feedback, and the resulting backlog changes. Keep a demo or recording timestamp and link the most relevant PRs or tests.

4. Sprint Retrospective

Week 3 asks how the team should change the way it works. The whole Scrum Team attends, and the Scrum Master helps facilitate. Use **Start / Stop / Continue** or **4Ls** to structure the discussion.

- **Revisit the previous action.** Did the team try it? What evidence shows whether it helped?
- **Discuss what went well and what caused friction.** Cover people and coordination, estimation, tooling, reviews, testing, CI, AI-assisted rework, and the Definition of Done where relevant. Ground the discussion in an incident the team can point to.
- **Agree on one or two concrete improvements.** Give each one an owner, a time to start, and a way to check whether it helped. For example, if PRs repeatedly waited on reviewers, try assigning a reviewer when a PR opens and check review turnaround next sprint.
- **Follow through.** Put the action where the team will see it during the next sprint. If an action comes from the final retro and hasn't been tried yet, describe it as an agreed next step.

Capture the retro board or notes, the incident behind each action, the owner, and evidence from a later sprint where available. An early issue followed by a documented change and a later result is a concrete example of the process improvement the rubric asks for.

Sprint 4: 18 oct - 31 oct

Discuss in the meeting	Capture for submission
Why this sprint? The Product Owner explains the highest-priority customer needs. Agree on one Sprint Goal that describes a usable outcome. For example, “An organiser can submit an event request and a coordinator can review it and communicate a decision.”	Sprint Goal, dates, and the customer need or release priority behind it.
What can we finish? Walk through the candidate story IDs, acceptance criteria, dependencies, and open questions. Decide what to include, split, or defer. If a Week 7 customer change affects this sprint, identify the stories, workflow steps, and tests it changes.	Selected stories and any important deferral or scope decision, with the reason and affected story IDs.
Why is that scope realistic? Compare the proposed work with recent completed work and this sprint’s actual availability. If you used planning poker, capture one estimate disagreement, the assumptions behind it, and what the team agreed after discussing it. Include review, testing, and integration effort when sizing a story. If you planned using throughput, show how completed item counts informed selection.	Actual estimation method, one worked example, prior completed points or throughput, capacity constraints, and planned scope. For an early sprint with limited history, record the assumption you used.
How will we deliver it? Sequence dependencies, break stories into tasks where useful, and agree how each workflow will be integrated and verified. Confirm what your Definition of Done requires. Developers can volunteer for tasks as the sprint progresses.	Start-of-sprint backlog or board export showing the goal, selected stories, and initial tasks. Include relevant test, review, or integration tasks.
